THYROID ULTRASOUND

HISTORY: Nodule

COMPARISON: Thyroid ultrasound 2019

FINDINGS:

Right lobe 42 x 24 x 21 mm. Left lobe 43 x 16 x 16 mm diffusely heterogenous and lobulated appearance of the thyroid gland. A discrete focal nodule is not seen.

IMPRESSION:

Extensive heterogeneity and lobulated appearance the thyroid gland , right greater than left. A discrete thyroid nodule is not definitively seen or measurable. The thyroid gland appear homogeneous and normal in appearance on prior ultrasound from 2019. The large heterogeneity and lobulated appearance of the right lobe of the thyroid gland could be on the basis of a large nodule although may alternatively represent sequela of longstanding thyroiditis. Recommend a repeat thyroid ultrasound in 6 months to reassess with consideration for optional FNA of the region of heterogeneous/lobulated appearance of the right lobe.

SUFFIX:

Thyroid Nodule Management Recommendations based on TIRADS criteria

TIRADS 1 - Benign. No FNA, no follow-up.

TIRADS 2 - Not suspicious. No FNA, no follow-up.

CHEMISTRY

ANTI-TPO	42	HI	< 35	kJU/L	10
Anti-Thyroid peroxidase antibody values up to 250 kIU/L may be seen in 5-10% of the normal population without demonstrable thyroid disease. This incidence increases with age.					
ANTI-TG	207	HI	< 40	kJU/L	
Test method: Roche Cobas immunoassay. Changes in serial results may be misleading unless all results are from the same laboratory method. Anti-Thyroglobulin antibody values up to 800 kIU/L may be seen in healthy people without demonstrable thyroid disease. New reagent formulation as of August 14, 2023 has reduced interference for high doses of biotin.
